**Corner fired panel  
reverse engineered**

**P**anels are among the most difficult products to manufacture, which is why experience is a key factor in selecting your vendor. Our history with this product line is extensive as our customer list will show. We have manufactured panels for all types of boilers including package, large industrial (including recovery type units) and utility boilers. Types of panels include flat, side waterwall, lower couton bottoms, arch, R.O.burner panels, corner fired units, cyclone units, low NOx conversions, over fired air ports, and other openings like sootblower and observation ports. Waterwall panels are assembled by using the high speed submerged arc process that provides high quality or meets or exceeds industry standards including the fusion welded process.

Studding can also be provided in a dense or super dense pattern. We are equipped to provide your panels any way you need them including gang bent and or with headers attached. At Chicago Tube and Iron we have the experience (86 years) and the knowledge to supply or meet all your pressure part needs. As a buyer, you want vendors who can supply a competitively priced product on time and per specification. At Chicago Tube & Iron we offer you, our customers, all of this and more. Please call or fax your inquiry to either our Chicago or Charlotte locations.
